InternNova Week 6 Project Report

Smart To-Do List — Git, GitHub & Final Web Development Project

Student: Mehvish Mukhtar

Live Website: https://mehvishmukhtar26.github.io/smart-ToDo-List/

GitHub Repository: https://github.com/mehvishmukhtar26/Smart-ToDo-List

1. Objective

The objective of this project is to build a simple, responsive and interactive To-Do List web application that helps users manage daily tasks through a clear and easy-to-use interface.

2. Project Overview

The Smart To-Do List is a front-end web application created using HTML, CSS and JavaScript. The project is hosted on GitHub Pages, and its source code is maintained in a GitHub repository. Git was used for version control and to record changes through meaningful commits.

3. Main Features

The application allows users to add new tasks, edit task names, mark tasks as completed, undo completion, and delete tasks. Users can filter tasks by All, Pending and Completed. A remaining-task counter displays how many tasks are still pending. Local storage keeps tasks saved in the browser after refresh. The layout adjusts for different screen sizes.

4. Technologies Used

HTML5 provides the page structure, CSS3 handles styling and responsive layout, and JavaScript manages task data, DOM updates, button events, filtering and local storage. Git and GitHub support version control and online code hosting, while GitHub Pages publishes the live website.

5. Git and GitHub Work

The project was committed locally and connected to the GitHub repository. During setup, the local and remote repositories had different histories and conflicts occurred in several project files. The conflicts were resolved by keeping the working local versions of the website and documentation, staging the resolved files, and creating a merge commit. The commit history screenshot provides evidence of the recorded changes.

6. Challenges and Solutions

The main challenge was reconciling the local project history with the existing GitHub history. I reviewed the conflict files, preserved the working website files, completed the merge, and checked that the website continued to work. This helped me understand how Git tracks changes and how merge conflicts can be resolved carefully.

7. Learning Outcomes

I practised structuring a website with HTML, styling it with CSS, adding interactive behaviour with JavaScript, saving data with local storage, and deploying a website using GitHub Pages. I also learned basic Git commands, meaningful commits, repository organization, and conflict resolution.

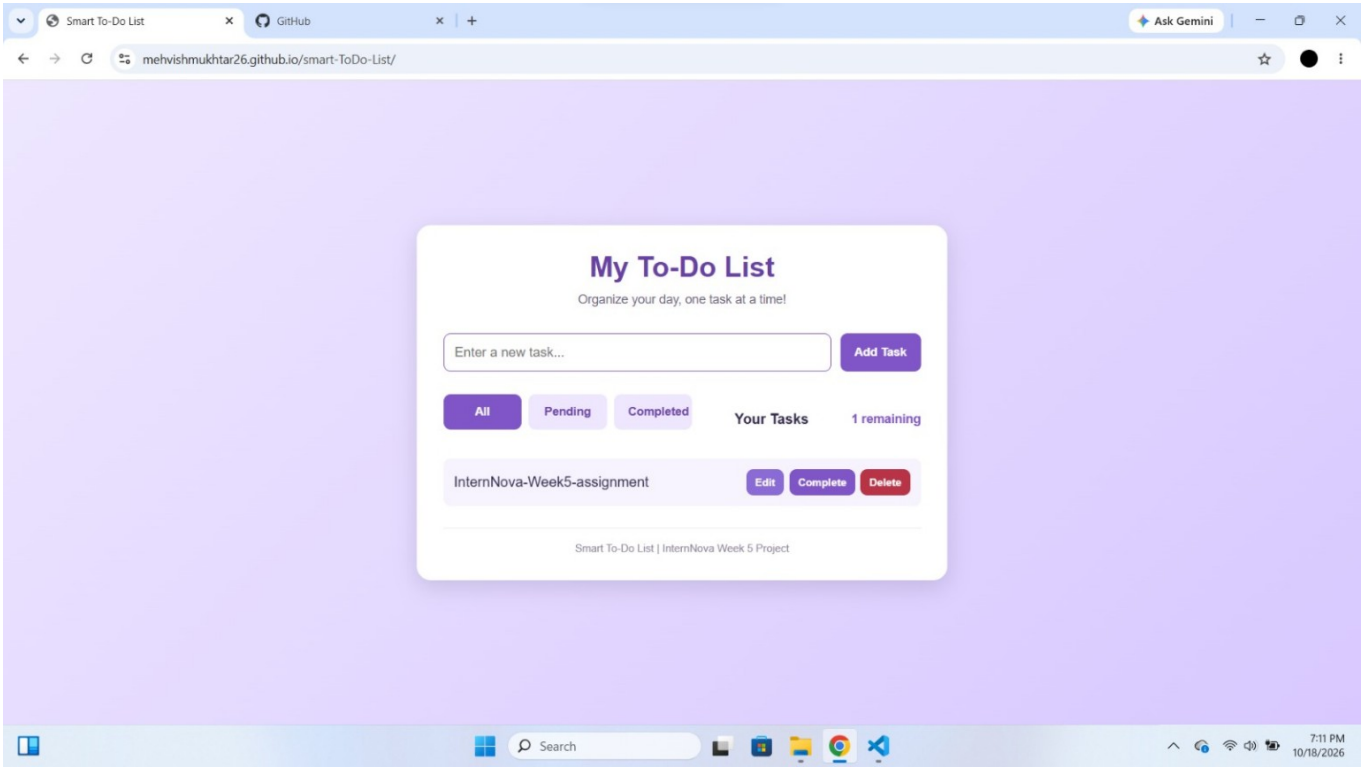

8. Future Improvements

Possible improvements include task deadlines, priority levels, categories, search, reminders, and optional account-based storage. These features could make the application more useful for managing larger task lists.

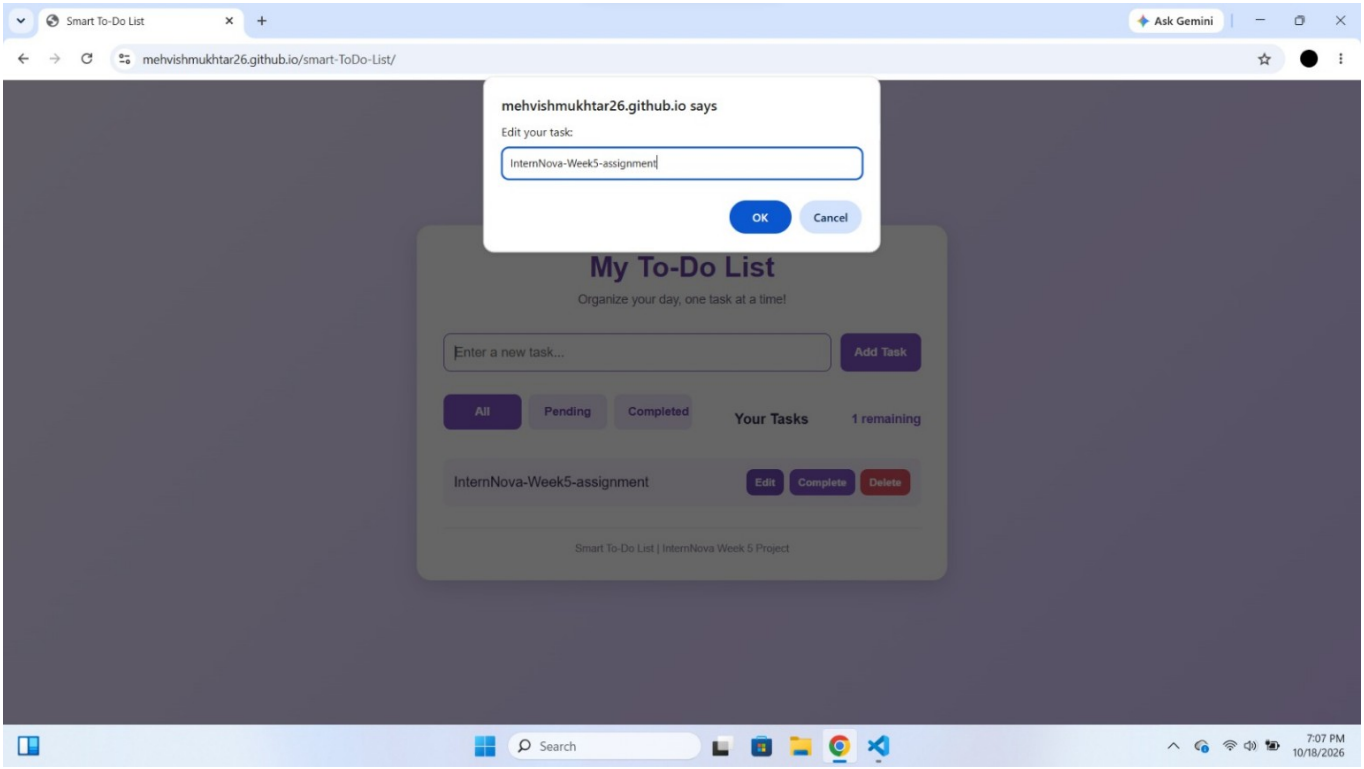

9. Screenshot Evidence

The screenshots below document the deployed application, its edit-task interaction, and the GitHub commit history.
